HPV infection is a necessary but not sufficient cause of cervical neoplasia. Our recent studies demonstrate that HPV is found in many women with mild or moderate dysplasia without histologic evidence of invasive carcinoma. The primary objectives of the proposed study are to 1) determine the prevalence of HPV in individuals with histologically confirmed cervical lesions; 2) determine if HPV is present in nuclei of anogenital or oropharyngeal mucosa; and 3) identify the specific HPV types present in cervical lesions. A nested case-control study will be carried out in a population-based cohort of 23,510 women aged 30-65 who are attending a birth-cohort clinic. Archival biopsies of the ectocervix will be obtained from cases of cervical intraepithelial neoplasia and invasive carcinoma. DNA amplification by PCR will be used to measure the presence of HPV and its specific types. HPV-DNA will be detected in 4,530 DNA extracts from normal cervical abnormalities will be matched with an equal number of normal controls using a systematic sampling method. The study population will be followed for a 2 year period. The study design will allow for the establishment of the prevalence of HPV, in women with CIN and cervical cancer. Identification of the specific HPV types present will provide th
